

Computer Science

Spring 2021 Lecture 14:

Dynamic Programming:

Longest Common Subsequence

2 Longest Common Subsequence

Input: Two sequences (strings etc)

Output: Longest common subsequence.

Examples of common subsequences:

exercise "eerie" determine

morning triangle

(toward) (thousand)

toward thousand

1: towa, thousan

2: toward, thousa

3 LCS: Recursive Solution

Let $LCS(n, m)$ be the length of the longest common subsequence of $X[1 \dots n]$ and $Y[1 \dots m]$.

if $0 == n$ or $0 == m$: return 0

if $X[n] == Y[m]$:

return $1 + LCS(n-1, m-1)$

else

return $\max(LCS(n-1, m), LCS(n, m-1))$

$LCS(n-1, m-1)$? overlapping subproblem

$LCS(n-1, m-1)$
 $LCS(n-2, m)$

$LCS(n, m-2)$
 $LCS(n-1, m-1)$

4 LCS: Iterative Solution

$LCS(n, m)$: // recursive for reference

if $n = 0$ or $m = 0$ then
return 0

base

else if $X[n] == Y[m]$ then

return $1 + LCS(n-1, m-1)$

else

return $\max(LCS(n-1, m), LCS(n, m-1))$

• smaller n OR
• equal n , smaller m

Declare $LCS[0 \dots n, 0 \dots m]$

for $i = 0 \dots n$ $LCS[i, 0] = 0$ } base

for $j = 0 \dots m$ $LCS[0, j] = 0$ }

for $i = 1 \dots n$

for $j = 1 \dots m$ // fill in $LCS[i, j]$

$O(1)$ { if $X[i] == Y[j]$: $LCS[i, j] = 1 + LCS[i-1, j-1]$
else $LCS[i, j] = \max(LCS[i-1, j], LCS[i, j-1])$

5

LCS Example:

			0	1	2	...			
			M	O	R	N	I	N	G
0		0	0	0	0	0	0	0	0
1	T	0	→ 0	→ 0	→ 0	→ 0	→ 0	→ 0	→ 0
2	R	0	→ 0	→ 0	→ 1	→ 1	→ 1	→ 1	→ 1
3	I	0	→ 0	→ 0	→ 1	→ 1	→ 2	→ 2	→ 2
	A	0							
	N	0							
	G	0							
	L	0							
→	E	0							

#

6

Finding the LCS itself

► We have $LCS[]$ filled in ← for all n, m

$i = n, j = m, S = \text{empty stack}$

while $i > 0$ and $j > 0$ **do**

{ // is $x[i]$ and $y[j]$ part of output?

if $x[i] == y[j]$

push $x[i]$ to stack.

$i--$

$j--$

else if $LCS[i, j] == LCS[i-1, j]$

$i--$

else $j--$

}

While S not empty

output $S.top()$

$S.pop()$

} equiv: $1 + LCS(i-1, j-1)$
